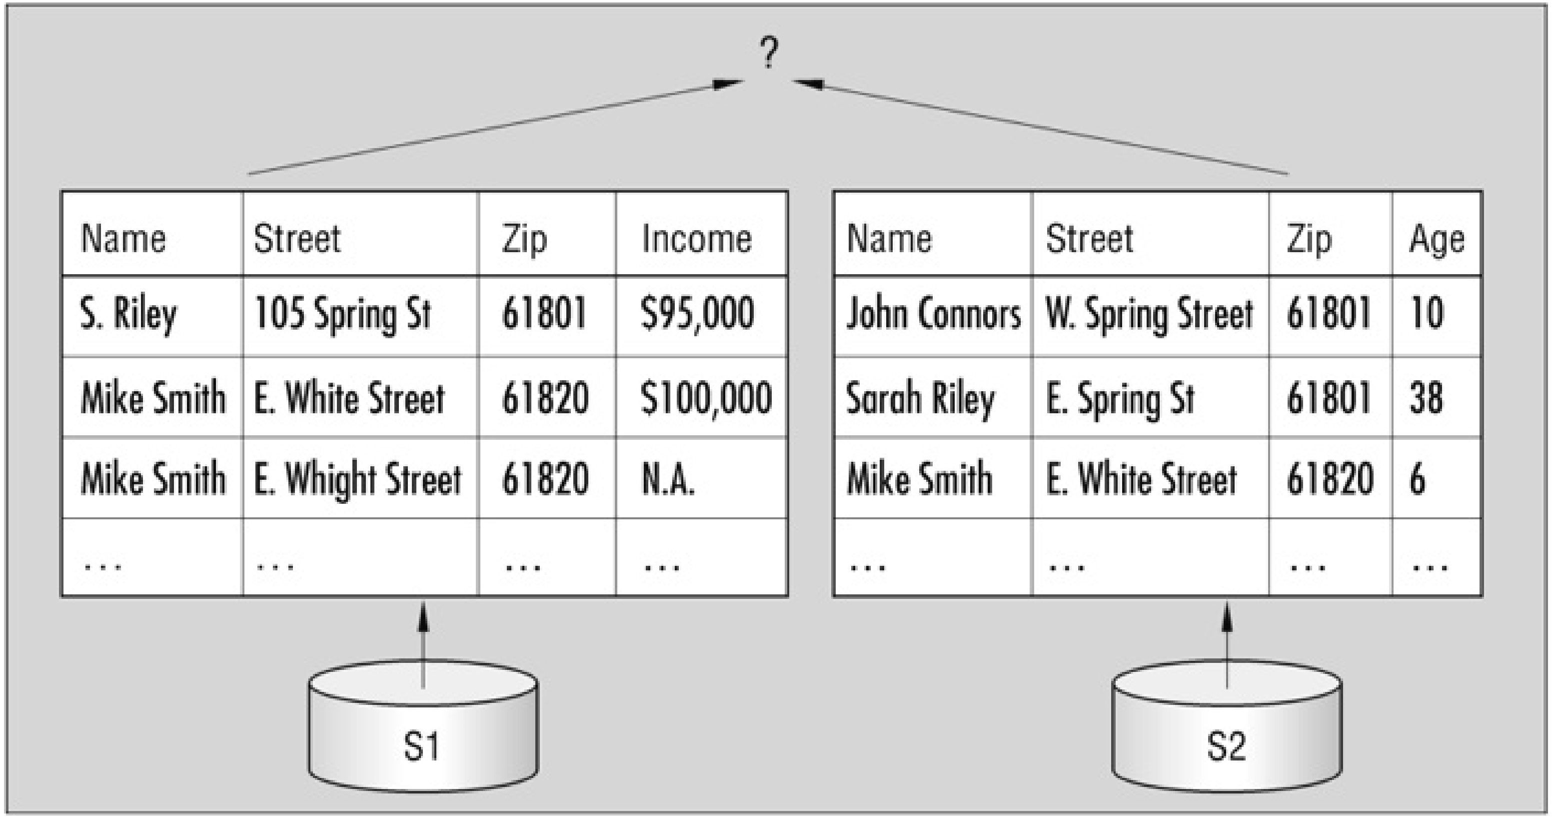
Data integration

Data integration is not easy



Name	Street	Zip	Income
S. Riley	105 Spring St	61801	$95,000
Mike Smith	E. White Street	61820	$100,000
Mike Smith	E. Whight Street	61820	N.A.
…	…	…	…

Name	Street	Zip	Age
John Connors	W. Spring Street	61801	10
Sarah Riley	E. Spring St	61801	38
Mike Smith	E. White Street	61820	6
…	…	…	…

Lu et al. 2013

Data integration aspects

Remember: difference between
DB schema and DB state

- Schema integration
  - Bring different schemata together
  - Equal concepts should be represented with equal types
- Object matching / Entity identification
  - Equal entities should be equally identified across datasets (unless re-identification forbidden by policy)

Data integration aspects (cont.)

- Redundancy analysis
  - Sometimes data needs to be integrated because different sets are row-incomplete
  - Sometimes those sets don’t form a partition ⇒ there will be repeated entities to be removed
- Resolution of value conflicts
  - Same entity, different attribute values

Data cleaning

Why data cleaning?

- Data collection technologies are inaccurate
  - Sensors
  - Optical character recognition
  - Speech-to-text data
- Privacy reasons
- Manual errors
- Data collection is expensive and inaccurate

What is data cleaning?

It is a process by which data records are

modified or deleted

until each record passes

data validity criteria

Data validity criteria (1)

- **Mandatory** constraints: certain columns cannot be empty.
- **Data-type** constraints: values in a column must be of a particular datatype
- **Range** constraints: numbers or dates should fall within a certain range
- **Regular expression** patterns: e.g., phone numbers [0-9]{9}

Data validity criteria (2)

- **Unique** constraints: a field, or a combination of fields, must be unique
- **Set-membership** constraints: values in a column come from a set of discrete values or codes
- **Foreign-key** constraints: set membership constraint where valid values in a column are defined in a column of another table that contains unique values

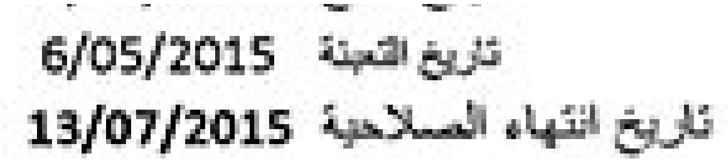
Data validity criteria (3)

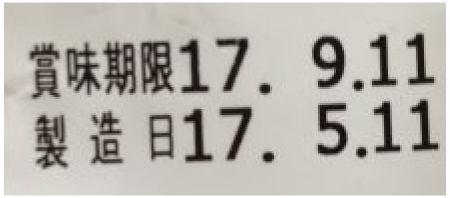
- **Cross-field validation**: certain conditions that utilize multiple fields must hold, e.g.:
  - percentages add up to 1.0 or to 100
  - discounted price lower or equal to regular price
  - date of expiration after date of manufacturing

Data validity criteria (3)

- **Cross-field validation**: certain conditions that utilize multiple fields must hold, e.g.:
  - percentages add up to 1.0 or to 100
  - discounted price lower or equal to regular price
  - **date of expiration after date of manufacturing**

    (useful when traveling!)





Handling missing entries
Why is a value missing?

- **Missing Completely at Random (MCAR)**
  - Missingness of a value is independent of attributes
  - Fill in values based on the attribute
  - Analysis may be unbiased overall
- **Missing at Random (MAR)**
  - Missingness is related to other variables
  - Fill in values based other values
  - Almost always produces a bias in the analysis
- **Missing Not at Random (MNAR)**
  - Missingness is related to unobserved measurements
  - Informative or non-ignorable missingness
- In general, it is not possible to know the situation just from the data

Handling missing entries: options

- **Delete** the data record containing missing entries
- Estimate or **Impute** the Missing Values
  - Additional errors may be introduced
  - Good under certain conditions (e.g., Matrix Completion)
- Some algorithms can work with missing data

Exercise: handling missing data (specify your assumptions)

Answer in
Nearpod Collaborate
Code to be given in class

Q1. 5% of student records at a university have no “civil status” (single, married, ...)

Drop records? Impute value, how?

Q2. 5% of smokers in a study of the effects of tobacco on health had no year of birth

Drop records? Impute value, how?

Q3. 5% of records of sales of a company have zip code but no province

Drop records? Impute value, how?

Q4. Temperature sensor at weather station was failing at random intervals during one day, total downtime 6 hours, max continuous downtime 15 minutes

Drop that day? Impute values, how?

Q5. Same sensor failed during one night, downtime 6 hours continuous

Drop that day? Impute values, how?

Handling Incorrect and Inconsistent Entries

- Inconsistency detection
  - E.g., full name and abbreviation don’t match
- Domain knowledge
  - Human age cannot reach to 800 (yet?)
- Data-centric methods
  - Outlier detection

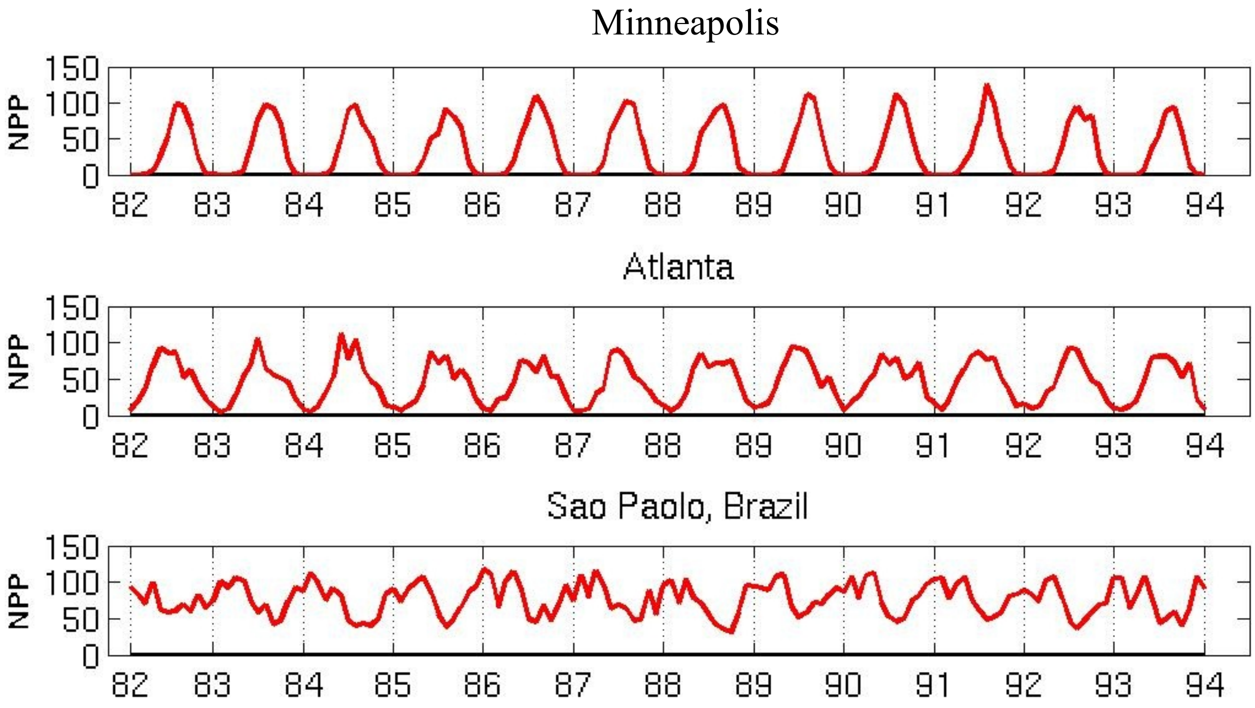
Scaling and normalization

- Features have different scales
  - Age versus Salary
- Standardization ("z-scoring")
  - Mean 0 and stdev 1
- Min-Max Scaling
  - Map to [0,1]
  - Sensitive to noise

$$z_i = \frac{x_i - \mu}{\sigma}$$

$$z_i = \frac{x_i - \min}{\max - \min}$$

Example: seasonal standardization



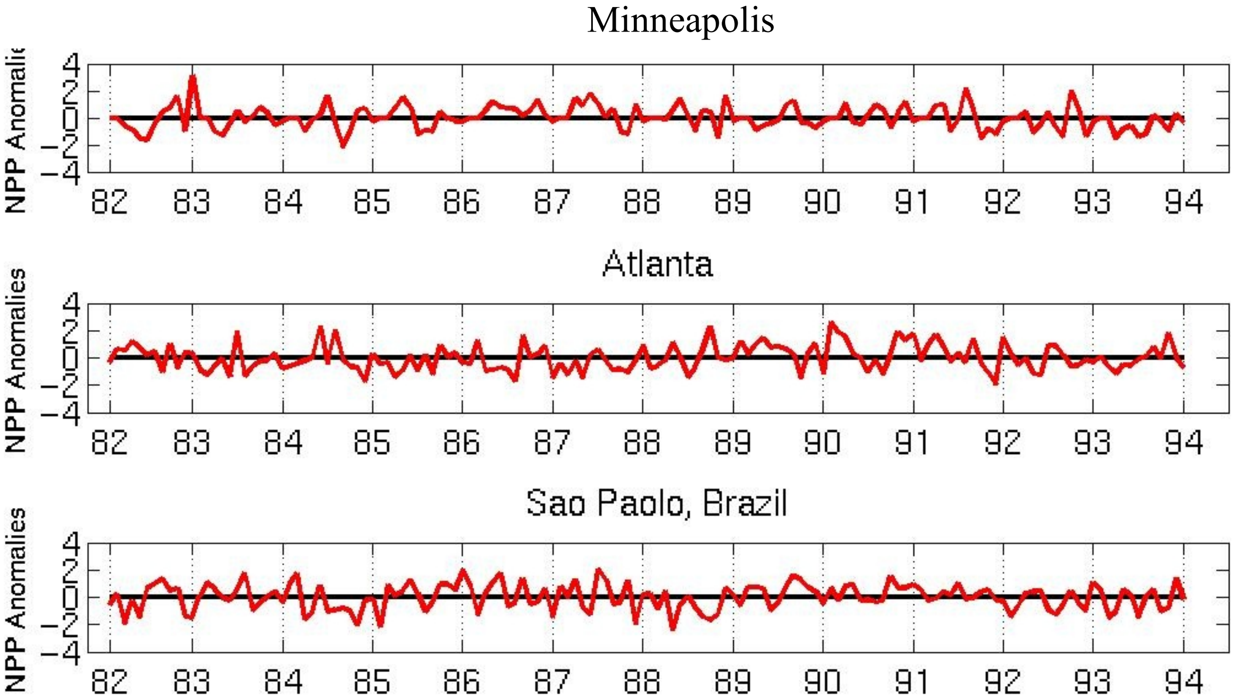
Net Primary Production (NPP) is a measure of plant growth used by ecosystem scientists.

	Minneapolis	Atlanta	Sao Paolo
Minneapolis	1.0000	0.7591	-0.7581
Atlanta	0.7591	1.0000	-0.5739
Sao Paolo	-0.7581	-0.5739	1.0000

Introduction to Data Mining 2nd edition (2019) by Tan et al. (Chapter 2)

Spurious correlations between time series

Example: seasonal standardization



Normalized using monthly Z Score:

Subtract off monthly mean and divide by monthly standard deviation

	Minneapolis	Atlanta	Sao Paolo
Minneapolis	1.0000	0.0492	0.0906
Atlanta	0.0492	1.0000	-0.0154
Sao Paolo	0.0906	-0.0154	1.0000

Adjusted correlations between time series

Introduction to Data Mining 2nd edition (2019) by Tan et al. (Chapter 2)

Summary

Things to remember

- Data cleaning
  - Specially: when and how to impute missing values

Exercises for TT03-TT05

- Exercises 3.7 of Data Mining Concepts and Techniques, 3rd edition (2011) by Han et al.
- Exercises 2.6 of Introduction to Data Mining, Second Edition (2019) by Tan et al.
  - Mostly the first exercises, say 1-6
